

Project brief

Buzzfeed Challenge

Your task for intro days is to implement the HTML and CSS knowledge you gained during pre-studies. You will create a webpage about a specific topic (it will be presented to each group separately). Your webpage should meet the requirements of SPA - Single Page Application. Basically, what that means is it should consist of only one HTML template file and corresponding CSS styles file.

Create the layout with HTML and then style it as you want with CSS! You will work in groups of five or six, using a **mob programming approach**. You have until Wednesday afternoon to finish, approximately 14:30 - easy peasy lemon squeezy, right?! 🍋

Remember:

- *Before you leave on the first intro day - the person who has the folder on their computer should send it to the rest of the group via slack (so that everybody has a copy).*
- *The same goes for when you're finished with the project - send the folder to the rest of the group*
- *After intro days - make sure to upload your project using the Typeform in the project brief (that can also be found below). Add your name and then add you team members as collaborators.*
- *Have fun!! 🎉*

HTML

- Start with thinking about your project topic to cover - how do you want to present it, what info, images and links you want to use
- Think about HTML structure and semantics - there are proper HTML tags designed for many cases. **Feel free to boost your knowledge up.** Use as many elements as you need!
- Create a layout using HTML elements learned from pre-studies. Your layout should at least include
 - Headings
 - Paragraphs
 - Images
 - Links

CSS

- Think about your design. **Here you can find some inspiration.**

- Choose your CSS approach - whether you want to style by selectors or classes? Pssst, **here is some help** if you want a reminder on how to reference by selector, class or many others.
- Think about what you want to style - is it going to be about dimensions, colours, shapes or spaces? This might help you when looking for a **proper CSS declaration**.
- Think about reusability - if multiple elements on your webpage should have the same style, maybe it's a good idea to create one generic class and add it to those specific elements?

Hand-in

After the intro days, you have to hand in your project here. Make sure that **everyone** from your project group hands in, even if you're working in a team or pair, make it a habit to always be responsible for your own hand-in every week.
